# SUSPENSION FOR THE RIDE OF YOUR LIFE

### The Company

Established in 1930, Lovells Springs is Australia's most experienced manufacturer of replacement coil and leaf springs for the automotive industry. Lovells have gained reputation as being at the forefront of spring design and manufacturing techniques as well as high quality suspension components by committing to the finest quality materials, skilled staff, computer spring design and test equipment, PLC (programmable logic controlled) manufacturing equipment and extensive road and race tested products to ensure "THE RIDE OF YOUR LIFE".

### Why Springs Are Replaced

To achieve improvements in the following areas:

- Ride Height
- Handling
- Load Carrying Capacity
- **♦** Comfort

### \* Ride Height

To restore the vehicle to its original standard ride height, when the original springs have sagged or weakened.

To lower the centre of gravity of the vehicle for enhanced appearance, performance and handling characteristics.

To raise the vehicle for increased ground clearance and load carrying capabilities eg. towing, LPG tanks, load bearing accessories.

### ♦ Handling

Lovells Springs ratings exceed that of original equipment springs by around 10%-50%, therefore handling is dramatically improved by controlling excessive body roll and brake dive.

### Load Carrying

Lovells offer a vast range of heavy duty uprated coil & leaf springs to increase the vehicle's load carrying capabilities and maintain stability when laden. These springs should be selected where a vehicle carries heavy loads, is used for towing, is fitted with LPG or larger fuel tank and other load bearing accessories i.e. bull bar, winch etc.

### + Comfort

Lovells Springs offer a vast range of variances in progressive and linear rate spring design, ratings and ride height options to enable the vehicle to be enhanced to the customers exacting comfort requirements.

### Spring Manufacture

Coil Springs

**Lovells Coil Springs** are designed as a superior replacement part for mass produced O.E. (Original Equipment) coil springs.

Lovells springs are designed on advanced computer aided design programs and sophisticated inhouse test machines, before extensive road testing and performance checks to ensure the ultimate performance of the product.

Lovells Springs are manufactured in accordance with ISO9002 to the highest standards in our own modern manufacturing facilities. All Lovells Springs are manufactured to exceed the appropriate Australian Standards using Australian made Onesteel (previously BHP) micro alloy spring steels supplied to AS1447-1991. All heating and tempering furnaces are electronically controlled to precise temperatures and each spring is formed on PLC machines.

All coil springs are shot peened to eliminate material surface defects and are powder coated with Lovells Blaze Blue © before being final inspected, labelled and packaged in a protective display box.

Lovells coil springs are available in linear rate (Fig A.) or variable rate (Fig B.) design depending on the application.

### **4x4 SPRING CATALOGUE**

# **Spring Manufacture** (Continued) Variable Rate Coil Springs

The principle of variable rate coil springs is as follows: Spring rates increase when you need it (i.e. cornering and load carrying) and decrease when you don't (i.e. normal comfort driving).

The simple rule is "less coils in a spring, the higher the spring rate". As the spring compresses under load the gathered coils come into contact and become inactive thus increasing the spring rate.

Note: Variable rate coil springs are not necessary for all vehicles and are only to be used in vehicles recommended by Lovells.

### **Leaf Springs (Laminated Springs)**

As per Lovells coil springs, leaf springs are designed as a superior replacement part for mass produced O.E. (Original Equipment) leaf springs.

Practically all leaf springs used on cars, 4x4's and trucks are of the semi elliptic type. The semi elliptic spring has function of not only a spring, it can dampen vertical deflection, supports the vehicle, positions the axle and cushions both driving torque and brake reaction.

Lovells leaf springs are once again manufactured using

premium quality OneSteel micro alloy steel.

Leaf springs are cambered on specially designed

machines before being assembled, rate tested and inspected. All leaf springs are enamel dipped in Lovells Navy Blue ready for despatch.

### **Ride Height Options**

Vehicle ride heights (Eye Brow Heights) are measured vertically from the centre of the wheel hub to the edge of the guard.

Vehicle ride heights are approximate only and can vary depending on:

- Age of vehicle
- Load Bearing Accessories (i.e. bullbars, winches, extra fuel tanks, fridges, spare wheel carrier etc.)

When selecting springs all of the these factors must be taken into consideration.

### Eye Brow Height

Measuring of the "Eye Brow Height -E.B.H." is illustrated in the following diagram

### FRONT / REAR

Designation	Approximate Ride Height Change
Std Height	Standard (Heavier Spring Rate than Original Equipment). UP TO 100kg CONSTANT LOAD
Raised	Raises vehicle by approx 25-50mm OR Maintains Std Height when vehicle is Fitted with Load Bearing Accessories UP TO 100kg CONSTANT LOAD
Raised H/Duty	Maintains raised height when vehicle is fitted with Load Bearing Accessories—increasing load carrying capacity UP TO 300kg CONSTANT LOAD

# Additional Part No. Prefix

**HD** - (Heavy Duty) extra heavy duty for Increased load carrying capacity ie. Larger fuel tanks, LPG tanks, camping / trekking cargo

LTO - (Long Travel Option) suits 4x4 vehicles with aftermarket shock absorbers which are normally longer than original and enable coil spring to remain trapped.

LTO part numbers also suit O.E.original length shock absorbers.

**HDLTO** - (Heavy Duty Long Travel Option) above two descriptions combined, suits 4x4 vehicles with longer shock absorber & increases load carrying capacity.

**L.B.A** - (Load Bearing Accessories) Accessories such as bullbars, winches, extra fuel tanks, fridges, spare wheel carrier etc.

NOTE: Spring selection for vehicles with L.B.A must be scrutinised carefully as variables such as location of equipment may change from vehicle to vehicle. The above details are given as an average only. Please consult Lovells Springs Pty. Ltd. for further details.

IMPORTANT: Pay close attention to all symbols, foot notes and advice in this catalogue.

INSTALLATION OF RAISED SUSPENSION SYSTEMS CAN INCREASE THE RISK OF VEHICLE ROLL OVER.

### Customer Specific Design and Spring Identification

If the springs you require are not listed in the catalogue, please make enquiries with our customer service technicians who will arrange for the manufacture of custom springs to your specification and / or sample

To achieve initial design parameters we will require the following:

Static (working) height:

The length of the coil Static spring whilst still mounted Height in the vehicle under normal load.

Trapped height: The overall

length of a coil spring

when still in the vehicle while the body of the vehicle is jacked up, to full extension of shock absorber.

Free height: The over-

length of a coil spring at its longest part while not under load i.e. out of the vehicle.

**Total coils:** Total number of

complete turns = 5.0 turns.

(in this example)

**Diameter of material:** Use Vernier caliper to measure.

Check at various points along coil and then check end coils as the diameter may vary.

Inside diameter (I.D): Use Vernier caliper to measure inside diameter of coil spring at both ends. Measure coil spring whilst (I.D) out of vehicle.

### Spring end finish:

Normal: Unground, straight cut.

Ground: Ground flat

**Reduced:** End coil finishes smaller in diameter than main coils.

### Fitting Guide

- 1. With vehicle on level (flat) ground, measure and record corner heights (E.B.H) from centre of rim to wheel arch.
- 2. With vehicle on flat ground measure and record static (working) height of O.E.M.(original) coils.(length of coil under load).
- 3. Lift vehicle and record trapped height of coil springs from front and rear. (wheels at full droop with springs and shocks still in vehicle).
- 4. Check inside diameter, top and bottom, of spring against O.E.M.(original) coils
- 5. Remove old suspension in accordance with vehicle manufacturers manual.
- 6. Reassemble new suspension components and fit to vehicle

Note: Final tensioning of all bolts & nuts to be done with suspension at normal ride height. Failure to observe this requirement may void any warranty.

7. Align vehicle to manufacturers specifications.

Place vehicle on level ground and record final corner heights (E.B.H) from centre of rim to wheel arch.

# Important: U-bolts must be checked regularly & retensioned.

For Maximum leaf spring life, after fitment of new leaf springs, U-bolts must be retensioned after 500km with vehicle fully laden.

Lovells recommend all U-bolts to be checked regularly & retensioned if required. Torque settings are available upon request.
